**Liqui-Box Bag-in-Box System
Bisphenol A (BPA) and Phthalates**

Bisphenol A (BPA), CAS Number 80-05-07, is a key building block or monomer used in the manufacture of polycarbonate resins, typically used in rigid containers for water. Phthalates are typically used as plasticizers for PVC films.

The components of Liqui-Box bag-in-box system are made of polyethylene, polyester, nylon, or other materials, depending on the specific application. Polycarbonate resins are not used in the manufacturing of the above-referenced components.

To the best of our knowledge, BPA and phthalates are not present in the formulation of the raw material used to manufacture Liqui-Box bag-in-box packaging. This information is based on supplier documentation, which we believe to be reliable.

In addition, we certify that Bisphenol A and/or phthalate compounds are not intentionally added in the manufacturing of Liqui-Box bag-in-box packaging.

We do not test for materials not reasonably expected to be present in our products.
